16

Unique Values for Tuples

RegNum	Surname	FirstName	BirthDate	DegreeProg
284328	Smith	Luigi	29/04/59	Computing
296328	Smith	John	29/04/59	Computing
587614	Smith	Lucy	01/05/61	Engineering
934856	Black	Lucy	01/05/61	Fine Art
965536	Black	Lucy	05/03/58	Fine Art

- Registration number identifies students, i.e., there is no pair of tuples with the same value for `RegNum`.
- Personal data could identify students as well, i.e., there is no pair of tuples with the same values for all of `Surname`, `FirstName`, `BirthDate`.

17

Keys

- A *key* is a set of attributes that uniquely identifies tuples in a relation.
- More precisely:
  - A set of attributes K is a *superkey* for a relation r if r cannot contain two distinct tuples t_1 and t_2 such that $t_1[K]=t_2[K]$;
  - K is a (candidate) *key* for r if K is a minimal superkey

  (that is, there exists no other superkey K' of r that is contained in K as proper subset, i.e, $K' \subset K$)

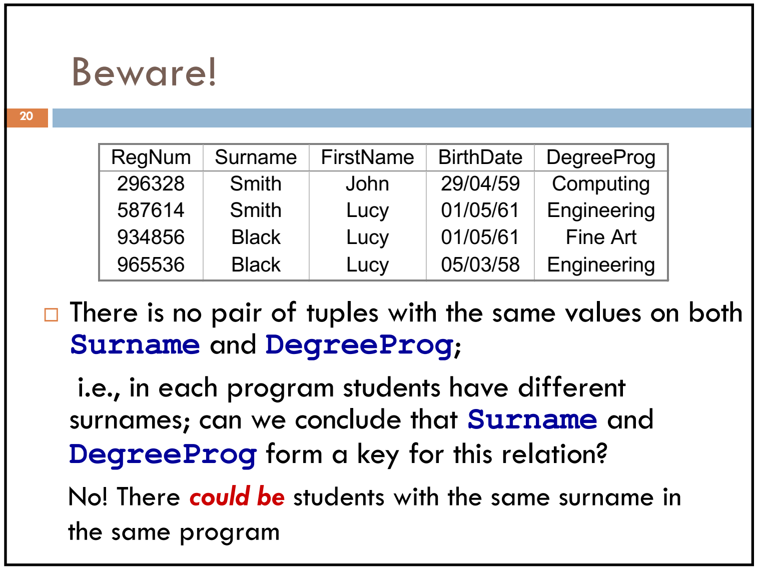
18

Example

RegNum	Surname	FirstName	BirthDate	DegreeProg
284328	Smith	Luigi	29/04/59	Computing
296328	Smith	John	29/04/59	Computing
587614	Smith	Lucy	01/05/61	Engineering
934856	Black	Lucy	01/05/61	Fine Art
965536	Black	Lucy	05/03/58	Fine Art

- `RegNum` is a key: i.e., `RegNum` is a superkey and it contains a sole attribute, so it is minimal.
- `{Surname, Firstname, BirthDate}` is another key

19



Beware!

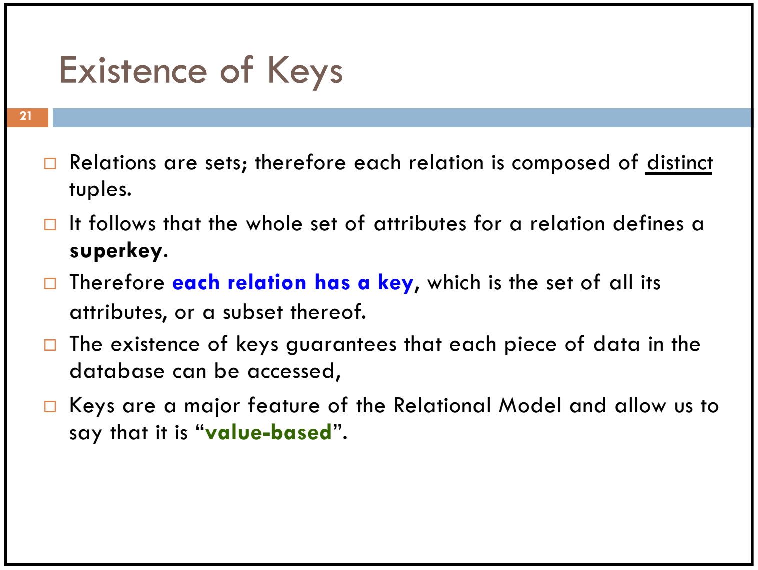
RegNum	Surname	FirstName	BirthDate	DegreeProg
296328	Smith	John	29/04/59	Computing
587614	Smith	Lucy	01/05/61	Engineering
934856	Black	Lucy	01/05/61	Fine Art
965536	Black	Lucy	05/03/58	Engineering

- There is no pair of tuples with the same values on both **Surname** and **DegreeProg**;

  i.e., in each program students have different surnames; can we conclude that **Surname** and **DegreeProg** form a key for this relation?

  No! There ***could be*** students with the same surname in the same program

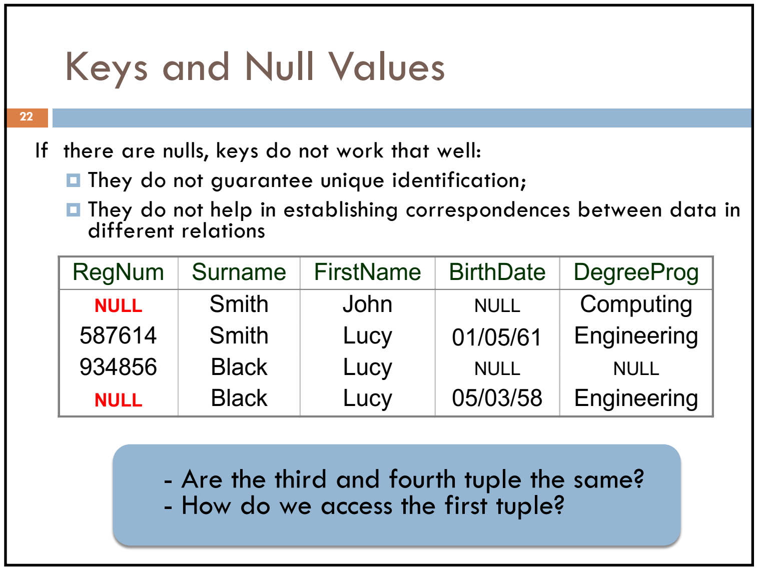
20



Existence of Keys

- Relations are sets; therefore each relation is composed of distinct tuples.
- It follows that the whole set of attributes for a relation defines a **superkey**.
- Therefore **each relation has a key**, which is the set of all its attributes, or a subset thereof.
- The existence of keys guarantees that each piece of data in the database can be accessed,
- Keys are a major feature of the Relational Model and allow us to say that it is "**value-based**".

21



Keys and Null Values

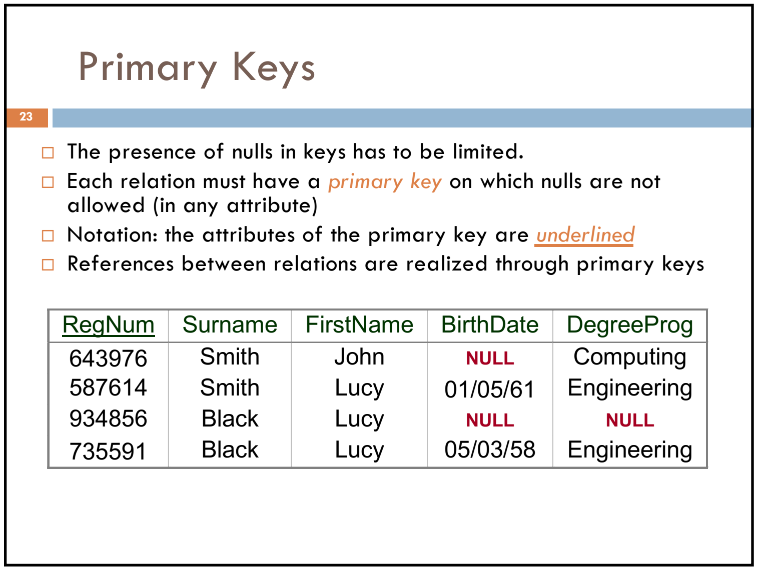
If there are nulls, keys do not work that well:

- They do not guarantee unique identification;
- They do not help in establishing correspondences between data in different relations

RegNum	Surname	FirstName	BirthDate	DegreeProg
NULL	Smith	John	NULL	Computing
587614	Smith	Lucy	01/05/61	Engineering
934856	Black	Lucy	NULL	NULL
NULL	Black	Lucy	05/03/58	Engineering

- Are the third and fourth tuple the same?
- How do we access the first tuple?

22



Primary Keys

- The presence of nulls in keys has to be limited.
- Each relation must have a *primary key* on which nulls are not allowed (in any attribute)
- Notation: the attributes of the primary key are *underlined*
- References between relations are realized through primary keys

RegNum	Surname	FirstName	BirthDate	DegreeProg
643976	Smith	John	**NULL**	Computing
587614	Smith	Lucy	01/05/61	Engineering
934856	Black	Lucy	**NULL**	**NULL**
735591	Black	Lucy	05/03/58	Engineering

23

Do we Always Have Primary Keys?

24

- □ In most cases, we do have reasonable primary keys (e.g., student number, SIN)
- □ There may be multiple keys, one of which is designated as primary.

24

Recap

25

- □ A set of fields is a key for a relation if:
  1. No two distinct tuples can have same values in all key fields, and
  2. This is not true for any subset of the key.
- □ If #2 false, then a *superkey*.
- □ If there's >1 key for a relation, one of the keys is chosen to be the *primary key*.
- □ E.g., *sid* is a key for Students. (What about *name*?) The set {*sid, gpa*} is a superkey.

25

Primary and Candidate Keys

26

Enrolled(sid, cid, grade)

1. "For a given student and course, there is a single grade." vs.
2. "Students can take only one course, and receive a single grade for that course; further, no two students in a course receive the same grade."

Enrolled(sid, cid, grade)

Enrolled(sid, cid, grade)

• key (cid, grade)

- Be careful to define Integrity Constraints (ICs) correctly at design time.
- ICS are checked when data is updated.

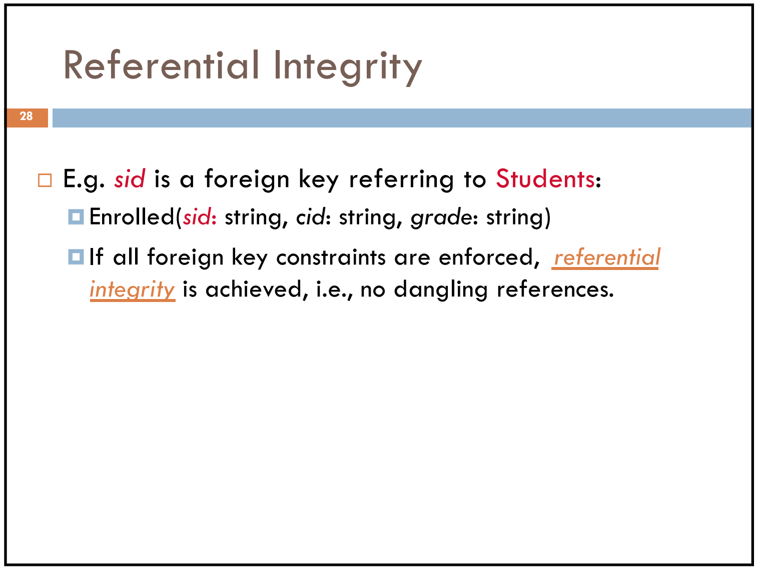
26

Foreign Keys

27

- □ Pieces of data in different relations are correlated by means of values of primary keys.
- □ Referential integrity constraints are imposed in order to guarantee that the values refer to existing tuples in the referenced relation.
- □ A *foreign key* requires that the values on a set X of attributes of a relation R_1 must appear as values for the primary key of another relation R_2.
  - ◘ In other words, set of attributes in one relation that is used to `refer' to a tuple in another relation. (Must correspond to primary key of the second relation.) Like a `logical pointer'.

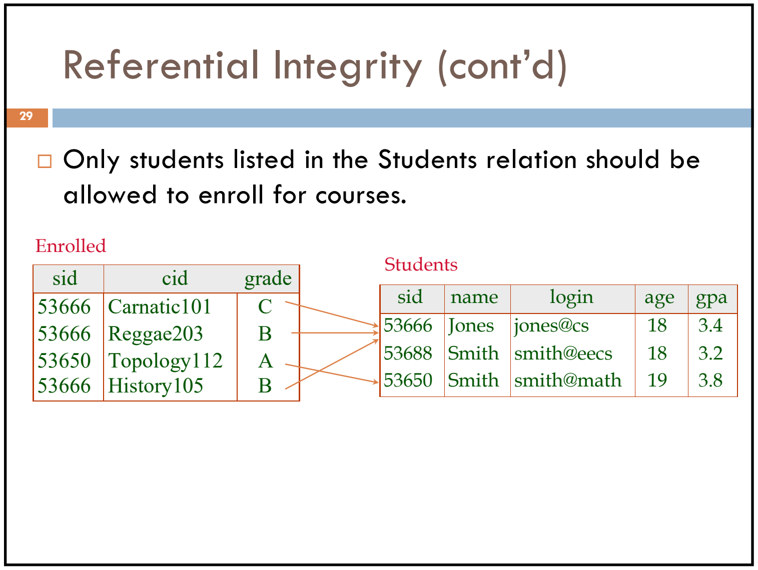
27



Referential Integrity

- E.g. *sid* is a foreign key referring to Students:
  - Enrolled(*sid*: string, *cid*: string, *grade*: string)
  - If all foreign key constraints are enforced, *referential integrity* is achieved, i.e., no dangling references.

28



Referential Integrity (cont'd)

- Only students listed in the Students relation should be allowed to enroll for courses.

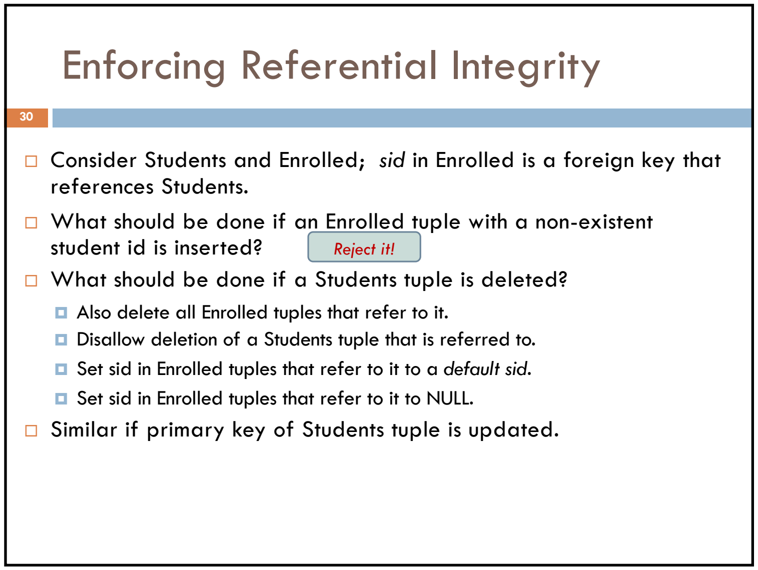
Enrolled

sid	cid	grade
53666	Carnatic101	C
53666	Reggae203	B
53650	Topology112	A
53666	History105	B

Students

sid	name	login	age	gpa
53666	Jones	jones@cs	18	3.4
53688	Smith	smith@eecs	18	3.2
53650	Smith	smith@math	19	3.8

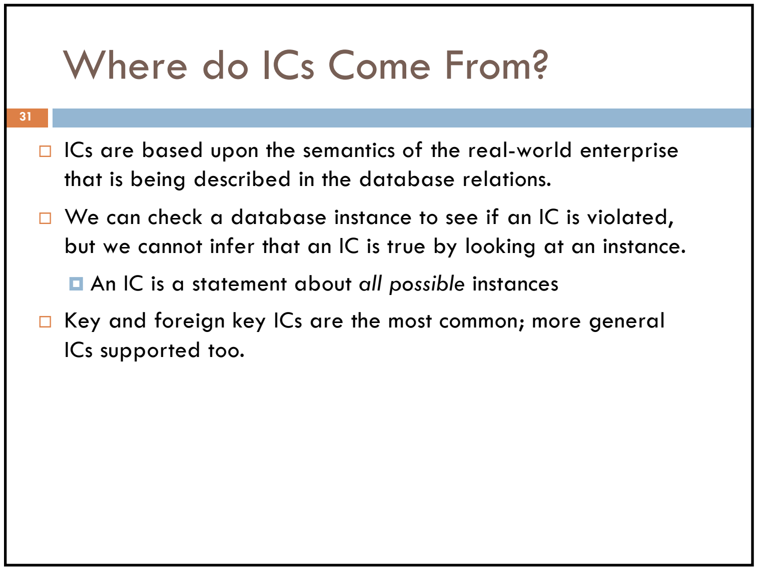
29



Enforcing Referential Integrity

- Consider Students and Enrolled; *sid* in Enrolled is a foreign key that references Students.
- What should be done if an Enrolled tuple with a non-existent student id is inserted? *Reject it!*
- What should be done if a Students tuple is deleted?
  - Also delete all Enrolled tuples that refer to it.
  - Disallow deletion of a Students tuple that is referred to.
  - Set sid in Enrolled tuples that refer to it to a *default sid*.
  - Set sid in Enrolled tuples that refer to it to NULL.
- Similar if primary key of Students tuple is updated.

30



Where do ICs Come From?

- ICs are based upon the semantics of the real-world enterprise that is being described in the database relations.
- We can check a database instance to see if an IC is violated, but we cannot infer that an IC is true by looking at an instance.
  - An IC is a statement about *all possible* instances
- Key and foreign key ICs are the most common; more general ICs supported too.
